OUTLINE

- motivation.
- course logistics.
- course overview & basic concepts.

MOTIVATION

Why learn ML ?

- AI is the new electricity

major tech disruption - opportunity to remake meaningful parts of

- Top-desired IT skill.

the world, it one behaves in ethical, principled mannes:)

- Applications in academia & industry across disciplines.

Goal: become expert in ML in 10 weeks.

- -apply state-of-the-art ML techniques to domain problems
- Well-qualified for doing my research.

m.L applications:

- Tasks hard to be programmed by hand: handwriting recognition, autonomous driving.
- Data mining: medical records -> medical knowledge.
- Daily like: Fraud detection, recommender systems.

CLASS LOGISTICS

Aferequisites:

- Computer science: programming (python+numpy), big 9, stacks, queues, birrory trees.
- Probability: random variables, expectation, variance.
- Linear algebra: vectors, matrices, array multiplication, eigenvalue problems.

> undergrad coverses

Class materials / stading:

- Lecture notes: technical details.
- Discussion sections coptional): refreshes of prerequisites,

advanced topics (eg, convex optimization, hidden marker model, time series).

- 4 problem sets: math-coding, Bairly difficult
 - -mid-term: timed, take-home.
- Final project usually applied mr. & List at past projects

Companison of classes:

- C5.229: more mathematical/theoretical, less applied/hands-on.
- CS229 A: more applied, blipped classroom format (coursea + discussions).
- cs230: ~ cs229. A instyle, but focus on DL.

is time permits, encouraged to take multiple classes to goin.

different perspectives.

ML DEFINITION

Arthur Samuel (1969)

- ML: Sield of study that gives computers the ability to learn 10.0 being explicitly prostammed.
- checkers playing program through self-play, program learned board patterns leading to wins/losses of bear him!

 a 1st example of computers outperforming humans in narrow tasks.

Tom Mitchell (1998)

- Well-posed learning problem: a computer is said to learn from experience E w.nt. some task T. 4.

some performance measure P. if its performance on T, as measured by P,
improves w. E.

E: experience of self-play

T: playing checkers.

P: probability of wins.

I SUPERVISED LEARNING

(Ex) libusing price prediction

featureis) labelis)

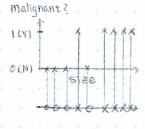

Superioused learning: given "light answers"/ labelled data (x,y) pairs => find functional mapping from x to y.

· One possible taxonomy of ML based on type of supervision / task:

(EX) Breast tumor prediction.

(Superiorised) (unsupervised) (reinforcement)

In reality = over lap (eg) semi-supervised learning

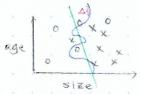

Classification: predict discrete y.

(eg) malignant, benign. -> Binary classification.

-> may have multiple categories.

(eg) beingn, type A, type B. → Multiclass classification.

er multilabel classification

- may have multi-dimensional input.

leg) tumor size, age of partient, umformity of cell shape.

4) How to select features?

SVM: use kernel trick to deal w. ap-dim input!

LEX) Autonomous driving a. ALVINN:

· Supervised learning: get steering directions from humans, - no longer state-of-the-art

- Regression: yelR.

discretized in actual implementation

II. ML STRATEGY/LEARNING THEORY

- general, model-agnostic principles.

- Not only give the tools, but also the know-how of applying them well.

- Most effective ML practioners: make strategic decisions on what to try next

- This course: demystify black-box magic, codify systematic engineering principles. & ML Yearning book

II. DEEP LEARNING

representation learning is manual secture engineering

- Can be use in supervised learning, Unsupervised learning, reinforcement learning. Socus of this course. Sleg) autoencoders, Seg) deep RL

Built programs that

→ ML: one approach

I UNSUPERVISED LEARNING

— can be used as a data preprocessing step (eg. PCA. > reducedim,

Supervised learning: labelled data.

dustering - group pixel types for computer VISION

> find interesting structures in data.

Clustering: partition data into different groups.

(Ex) Clustering:

- Google news: group anticles into coherent stories.
- aenome data: divide indivisuals into different types
- Social network analysis: identify cohesive communities
- market segmentation group customers into sub-populations for target-specific marketing.
- Organizing computer clusters: find which machines, coorflows are more related

(2x) Cocktail party problem:

Independent - component analysis (ICA): given recordings to overlapping voices

an extension of PCA that Sinds the direction of maximum kurtosis

⇒ figure cut they can be explain by n independent sources & separate them out.

instead of variance using 5VD

- optimze higher-order statistics.

(EX) Learning analogies from unlabeled text data:

Voman: man :: kina: quee

Woman: man : king: queen tokyo: japan: : do: usa · Word embadding: represent words by rectors.

relation encode direction

nan A queen

· Vector space model (VSM) Brom information retrieval:

Optimize cosine similarity between semantic relation vector for A&B

and that for C&D.

I REINFORCEMENT LEARNING

Supervised Learning: learn one-shot decision making

Beinforcement learning: learn to make a sequence of decisions

17 supervised/unsupervised learni

- -don't know optimal solution, but can desine good/bad behavior (implicit feedback).
- -agent con query feedback interactively from environment active learning. A learn optimal policy that maximizes/minimizes accumulative reword/penalty. Through trial # evror.

(Ex)

- tobotics
- game playing (Altari, Go)
- autonomous driving
